1. If the handler never allows the animal's \_\_\_\_\_ to drop, a steer or heifer will seldom escape.
2. The \_\_\_\_\_ (also known as the bowknot or reefer's knot) is the standard knot used to tie an animal to a post or stall at the fair.
3. Knot users consider the \_\_\_\_\_ knot one of the most useful knots. It is a nonslip knot, as such it can be used to form a loop that will not tighten or draw down.
4. Beef, swine, and dairy cattle are partially \_\_\_\_\_ and have poor depth perception.
5. The key to safely handling animals is being aware of and respecting animals comfort or \_\_\_\_\_.
6. Livestock animals have wide angle vision. They can see everything except what is in their \_\_\_\_\_, which is directly behind them.
7. There are four basic types of identification: \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, and freeze branding.
8. The \_\_\_\_\_ is not a desirable form of identification, simply because of the damage it causes to the \_\_\_\_\_, the \_\_\_\_\_ on the animal and special equipment that is required.
9. Separate new animals on the farm from the rest of the herd for \_\_\_\_\_ to \_\_\_\_\_ days. Also separate animals you have taken to a show from the animals left at the farm because show animals have been in contact with other animals and could have contracted a disease organism.
10. There are two types of flies that are major pests to cattle: the \_\_\_\_\_ fly and the \_\_\_\_\_ fly.
11. Ringworm is a \_\_\_\_\_ that gets into the skin and develops a rough skin condition where the hair drops out in patches. You can get ringworm on your skin by handling infected cattle. You should wear \_\_\_\_\_ when handling infected animals.

Answers to these questions can be found in the "Beef Resource Handbook" 4-H 117R
